

# Improving Your Network Defense

**Joel M Snyder  
Senior Partner**

**Opus One**

**jms@opus1.com**

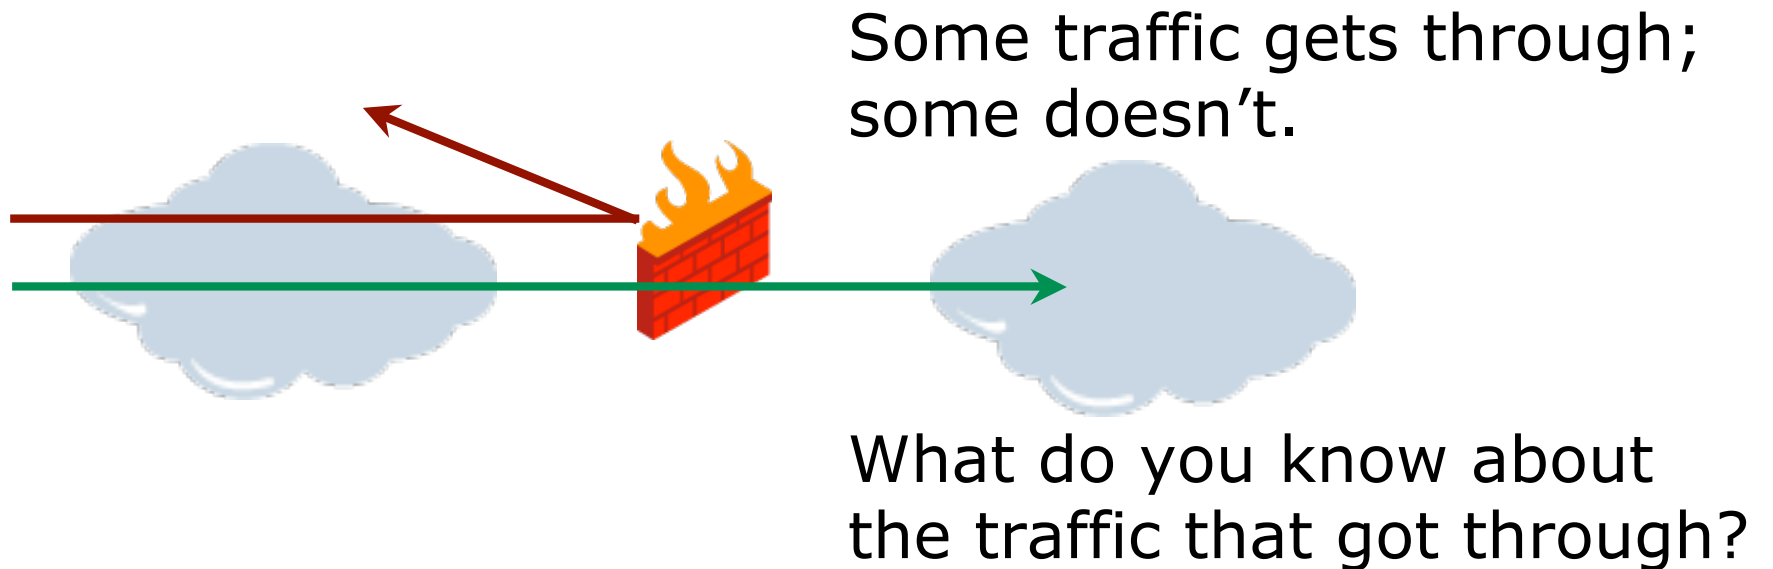

# Agenda: Improving Your Network Defense

- **What's the Thesis?**
- **Intrusion Detection**
- **Collecting Information**
- **Enabling Features**
- **Vulnerability Analysis**
- **Network Access Control**

## A Firewall Blocks Traffic, but...

- **A firewall cannot tell you how your network is operating**
- **A firewall cannot tell you whether your network is secure**

# Improve Network Security with Visibility and with Control

## Visibility

- **Means: Knowing what is happening on the network from a SECURITY point of view**
- **Also may mean: Knowing what is happening on the network from a NETWORK point of view**
- **(these “points of view” are not that far off)**

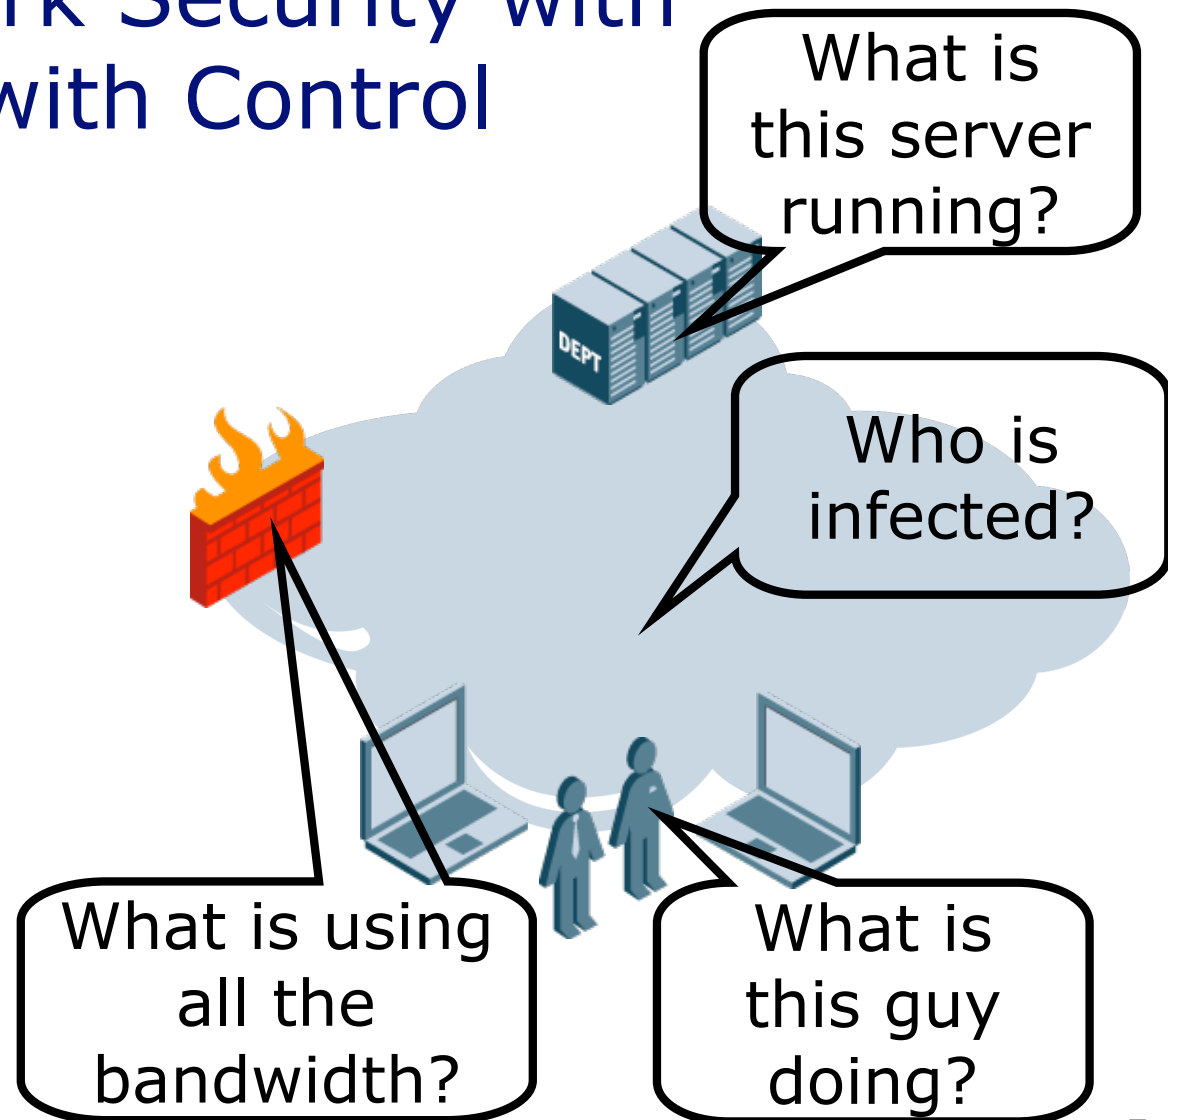

## Control

- **Means: Enabling control points on your network to direct and manage traffic**
- **Means: Changing the network to be a secure asset rather than an anything-goes utility**

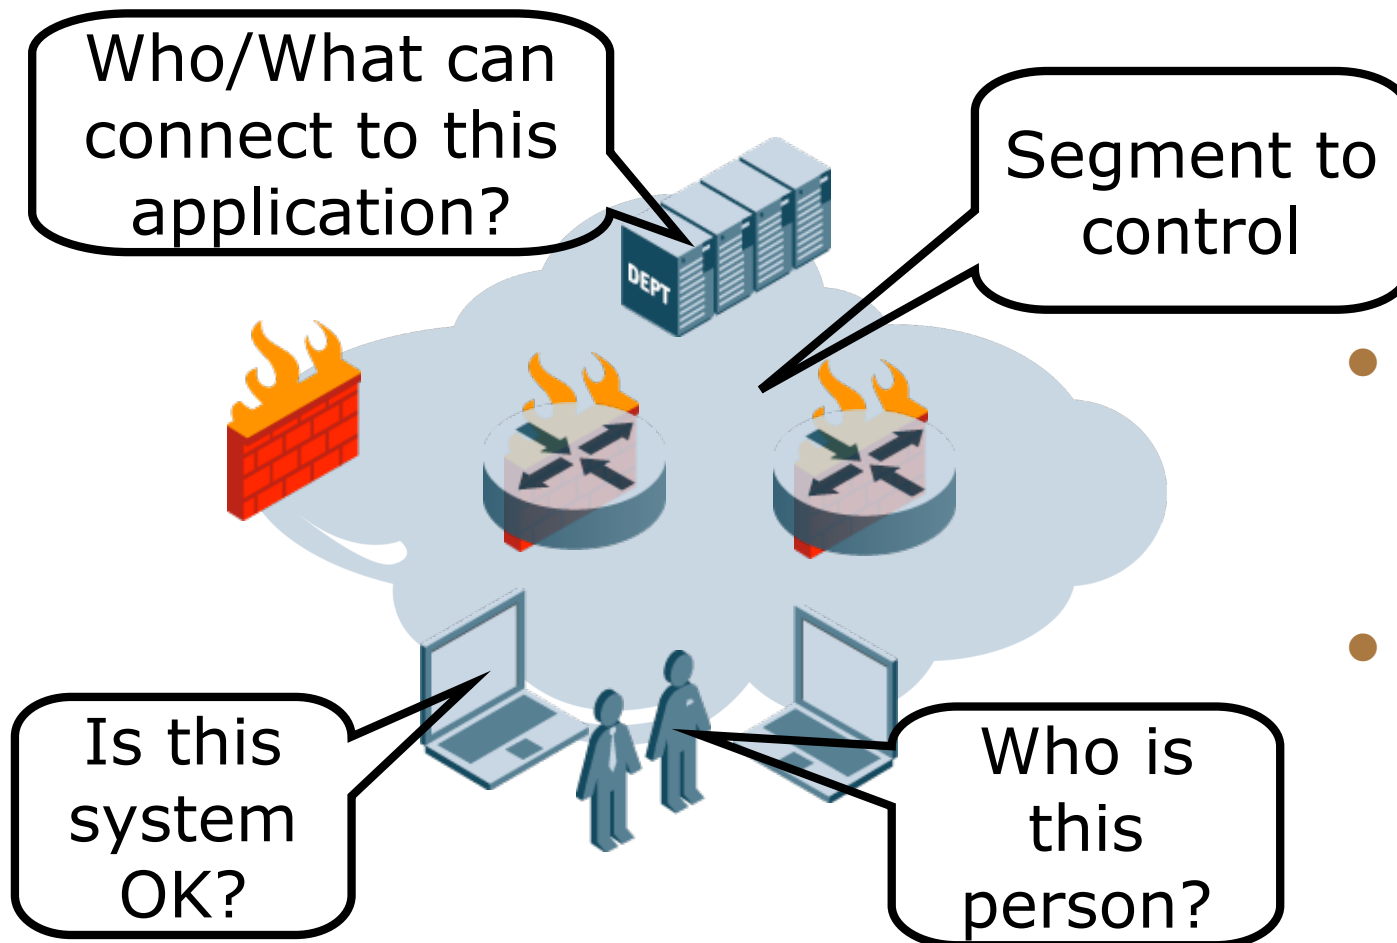

# Improve Network Security with Visibility and with Control

## Visibility

- Means: Knowing what is happening on the network from a **SECURITY** point of view
- Also may mean: Knowing what is happening on the network from a **NETWORK** point of view
- (these “points of view” are not that far off)

# Improve Network Security with Visibility and with Control

## Control

- **Means: Enabling control points on your network to direct and manage traffic**
- **Means: Changing the network to be a secure asset rather than an anything-goes utility**

## Goal:

Increase your ability  
to see security  
issues within  
the network

## Strategy:

Add  
NIDS Intrusion  
Detection Sensors  
inside the  
core & DMZ networks

# IDS is not *really* for detecting Intrusions

Security policy violations

Infected systems on your network

Mis-configured applications, firewalls,  
and systems

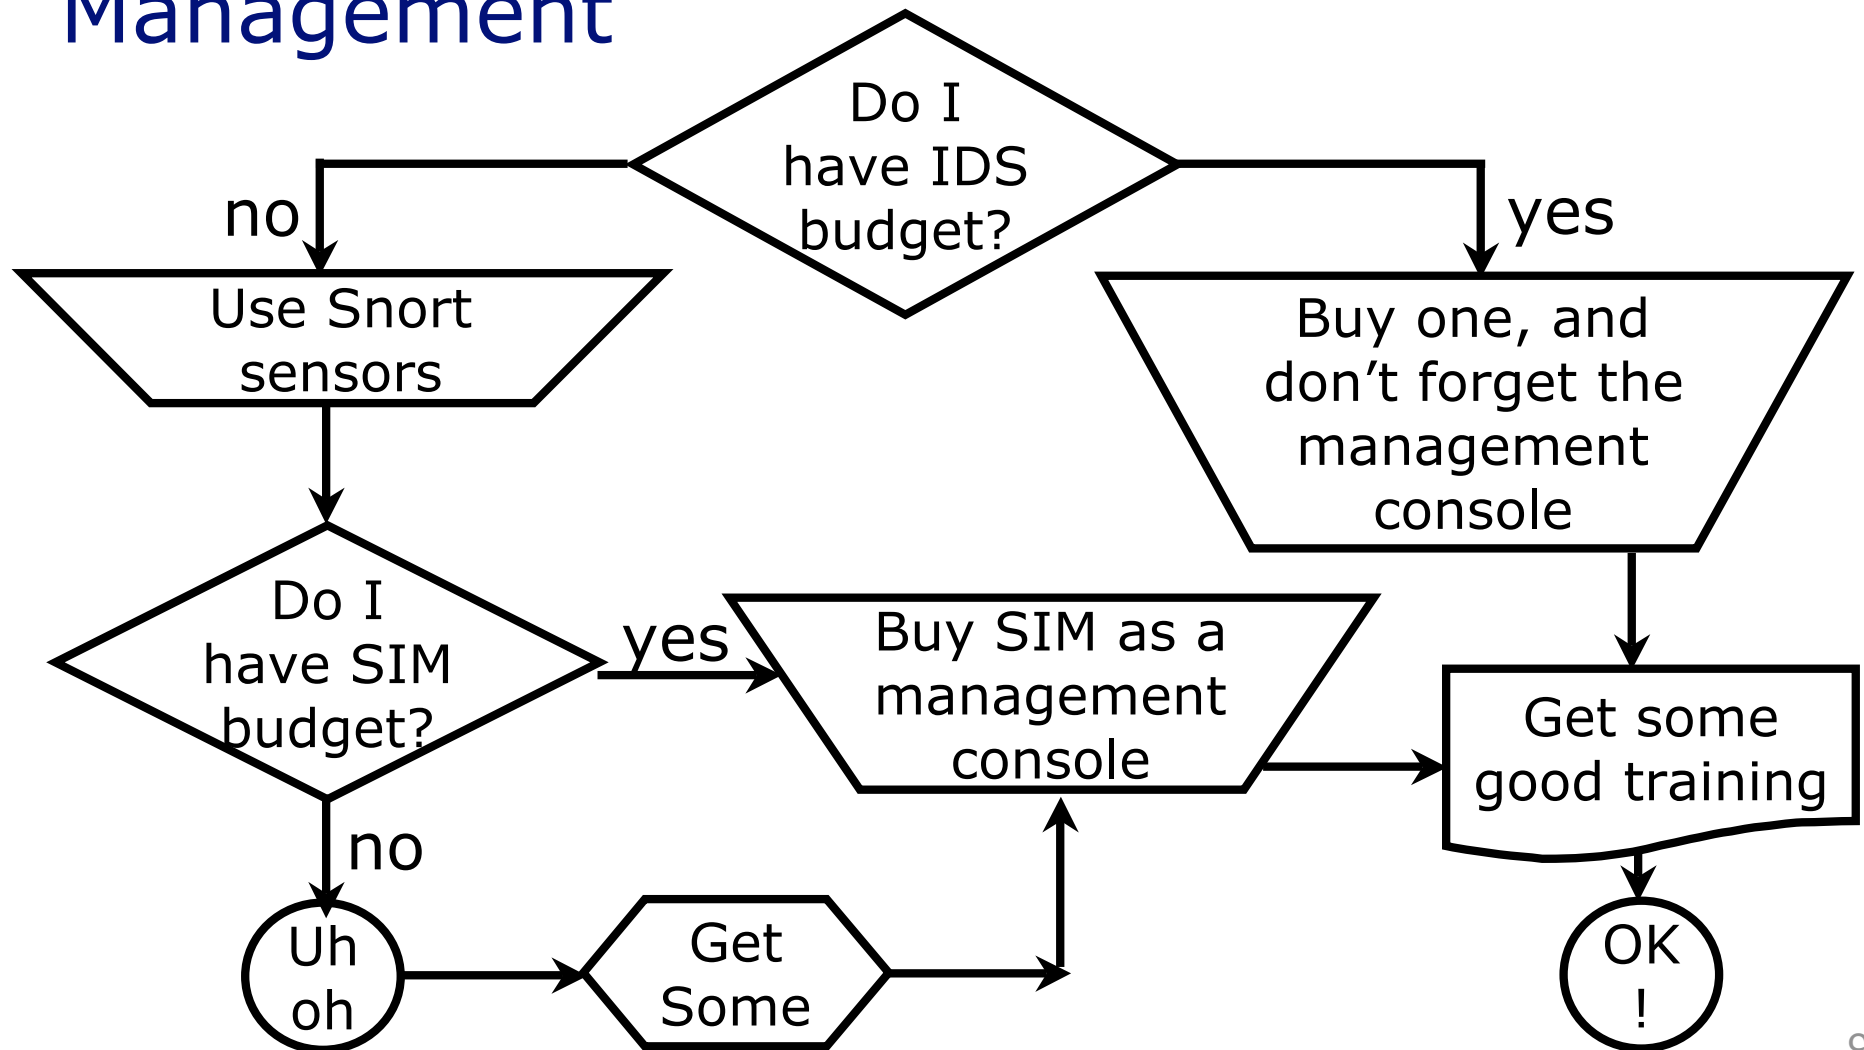

Information leakage

Unauthorized servers and clients

A properly configured firewall and patch discipline means that an IDS is unlikely to catch an "intrusion"

# What's hard about IDS is Management

# Most Common Errors in IDS Deployment and Operation

- 1) Putting Sensors in the Wrong Place
- 2) Not Customizing IDS for Your Environment
- 3) Not Linking IDS to Network, Application, and Security Knowledge
- 4) Not Listening to What the IDS Says
- 5) Mistaking IDS for IPS

No, really. If you aren't going to use the console *at least* once a week, you probably don't want to put this in place

An IPS drops packets; it's a firewall with a default-allow policy.

An IDS looks for anomalies, policy violations, malicious traffic, and funny packets.

# We'll dive deep into IDS later today

Smart Defense PPT.ppt

1. We're Going to Backtrack... Place Sensors in Same Place

2. You Have to Place Your IDS Sensors Somewhere, Right?

3. For Most Networks, IDS/IPS is Focused on the Inside

4. If You're Blocking Attacks With IPS, Inside-Outside is Always Appropriate

5. You May Also Want to Control or Restrict DMZ

6. Why?

7. IDS/IPS Can Go Anywhere in the Network, But Have Devices

8. When Working Inside, More IDS/IPS Points Are Better

9. Managing Segments

10. Finding a Place to Plug in an IDS Can

11. Modern Networks Are Not for Simple Top (IDS)

12. Highly Switched Networks

## Goal:

Gain better insight  
into traffic and  
flows within  
the network

## Strategy:

Collect  
and Analyze  
security and flow  
information  
from existing control  
points

# You already have an abundance of instrumentation... use it!

Routers  
Firewalls  
Switches  
Load Balancers  
Systems/Servers

# Who is Talking and How Much? You already know!

## Switches:

Generate Link Up/Down

Have traffic flow data (SNMP)

Have network topology info.

## Routers:

Generate flow records (NetFlow, sFlow, etc.)

Generate ACL permit/deny

## Firewalls:

Generate Accept and Deny

Generate traffic flow data in session end records

## Once you have the data, you can answer important questions

Of course, it's not as easy as turning on logging and flow data

<b>Asking for the data is pretty easy</b>	<b>Understanding and analyzing the data requires additional tools</b>
<b>The data will be expressed in "network" terms (such as IP address)</b>	<b>You probably want different terms (such as username or NETBIOS name)</b>
<b>Gathering Network Flow data may have other costs</b>	<b>Cisco platforms are optimized to route packets, not report on them</b>

## Action Items: Network Visibility

- **Investigate SIM products or open source tools to collect and *summarize* flow and session information**
- **Install open source tools or commercial products to monitor traffic counters at the switch port level and generate usage data**
- **Begin archiving session data (hey, disk is cheap) for future long-term analysis projects**

## Goal:

Gain greater and more granular control over all traffic

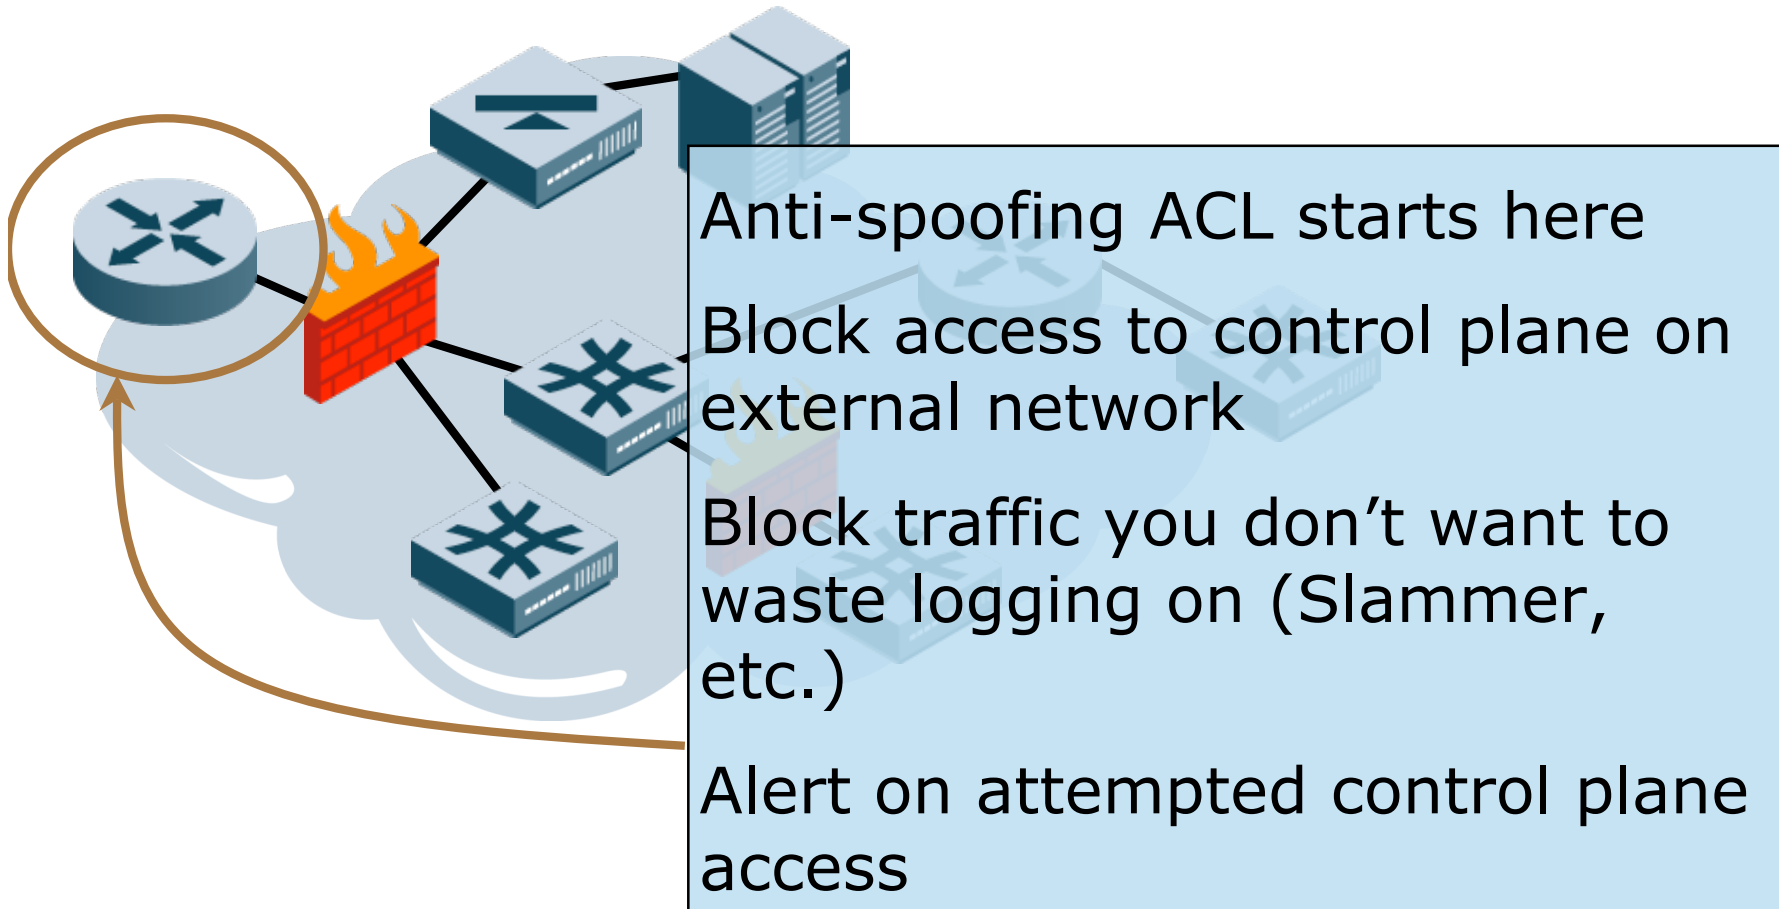

## Strategy:

Enable security on devices you already own such as switches, routers, and firewalls

Your network already has lots of security control points... use them!

## Your external router is a good first cleaner for traffic

Don't let the  
title mislead  
you: this book  
tells you how to  
secure your  
infrastructure  
Cisco devices!

# Are you using all the features you paid for in your external firewall?

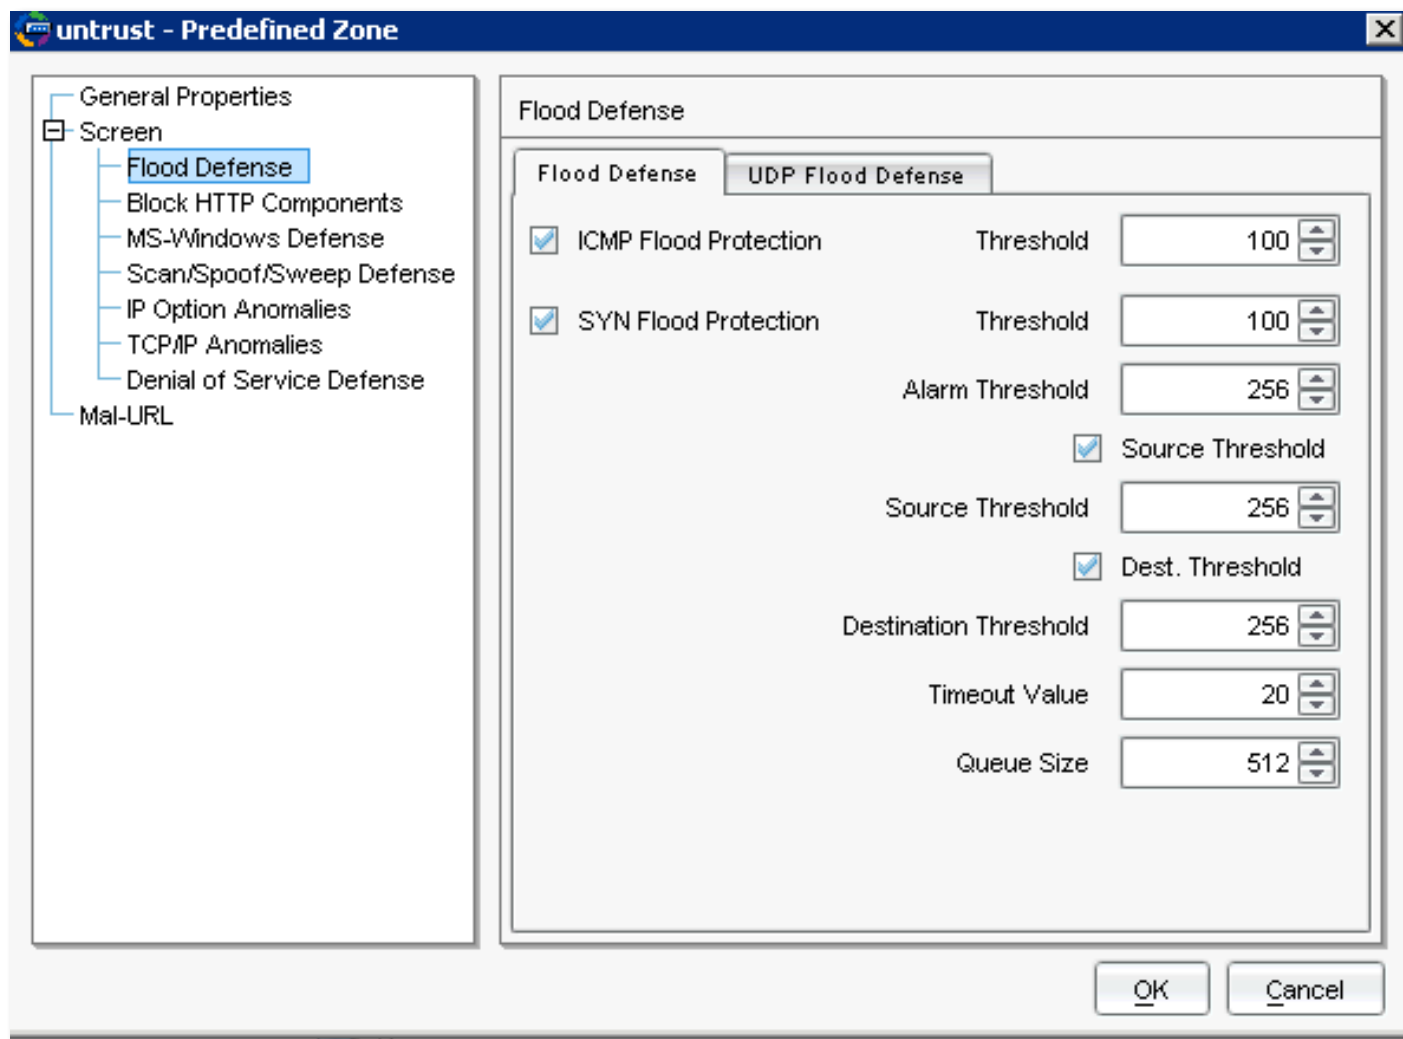

Most firewalls have rate-based DoS/IPS features... turn them on!

Do you have a "default pass all" for outbound traffic? If so, reconsider.

SMTP? Non-Web?

Secure your control plane traffic and disable non-secure management

Now is the time to explore all those  
little boxes

# Control traffic TO and THRU each device in the network

## **Control plane management:**

either a separate management network (best) or ACLs (good)

## **Traffic**

**management:** block and alert on common errors and worms; install anti-spoofing ACLs

## Action Items: Leverage Existing Points

- **Enable security features on security devices (such as firewalls) that you already have but are not using**
  - DoS protection most typical
  - Limited IPS features common
- **Put coarse controls at external devices to protect control/management plane, anti-spoofing, and common worms**
- **Secure internal control/management plane traffic using either a separate “access ether” or ACLs; configuration tools**

Goal:

Better understand  
the security  
posture of  
your own  
network

Strategy:

Use  
Active or Passive  
Vulnerability Analysis  
and Network Discovery

# Knowing what services are running on the network has great value

The Server Team may think they know what's going on, but getting a second opinion is always useful.

# Active Scanning pounds systems looking for apps and vulnerabilities

# Active scanning can tell you more than just services

## Examples include:

Nessus  
Retina  
Core Impact  
ISS  
SARA  
Qualys  
Saint  
MS Baseline  
nmap

## Active Scanning has a huge political cost that may drive you to Passive

- **Active scanning will crash systems and applications**
  - It's a side-effect of how these things work
  - Even the most gentle scan can crash applications
- **Active scanning is easily detectable and will set off alarms**
- **Sometimes folks don't like being scanned, especially if you work for different bosses**

# Passive Scanning watches traffic looking for apps and vulnerabilities

# Passive Scanning is more limited, but can give a lot of information still

Services
+ <a href="#">bootps</a>
+ <a href="#">domain</a>
+ <a href="#">ftp</a>
+ <a href="#">http</a>
+ <a href="#">imap</a>
+ <a href="#">netbios-dgm</a>
+ <a href="#">ntp</a>
+ <a href="#">pop3</a>
+ <a href="#">rsync</a>
- <a href="#">smtp</a>

Top  
Examples:  
Sourcefire  
Tenable

(But many  
IDSes do this to  
a limited extent  
anyway)

<a href="#">Vendor</a>
<a href="#">vn Version</a>
<a href="#">45.12.100:25/tcp</a>
<a href="#">45.12.102:25/tcp</a>
<a href="#">45.12.114:25/tcp</a>
<a href="#">45.12.116:25/tcp</a>
<a href="#">45.12.214:25/tcp</a>
<a href="#">45.12.217:25/tcp</a>
<a href="#">45.12.219:25/tcp</a>
<a href="#">45.12.227:25/tcp</a>
<a href="#">45.12.227:8025/</a>
<a href="#">45.12.228:25/tcp</a>
<a href="#">45.12.229:25/tcp</a>

## Host: 192.245.12.227

Hostname	Balder-227.Proper.COM
NetBIOS Name	
Reporting Detection Engine	sfs2.ids.opus1.com / sfs2.ids.opus1.com
Hops from sensor	0
Operating System	FreeBSD FreeBSD 5.3 or 5.4
OS Confidence	98
MAC Addresses (TTL)	<a href="#">00:08:21:04:16:40 (62)</a> <a href="#">00:0E:0C:67:C8:04 (64)</a> <a href="#">00:10:60:0A:75:10</a> <a href="#">00:A0:8E:99:8C:16 (63)</a> <a href="#">00:A0:8E:99:8F:02 (63)</a>
Host Type	Host
Last Seen	2006-12-03 05:13:02
Events	<a href="#">View</a>
IDS Events	<a href="#">Source</a> <a href="#">Destination</a>

## Attributes (4)

Host Criticality	Medium
Color of the Paint	Yellow
Wears a Plaid Shirt	False
Notes	Non-critical systems in Building C

## VLAN Tag

VLAN ID	Type	Priority	Priority
2	Ethernet	0	

## Host Protocols (5)

## Action Items: Network Scanning

- **Add regular nmap-style (service and O/S scan) services to your network**
- **Research tradeoffs between active and passive scanners to see which might be right for you**
- **Work with desktop/server team to determine areas where information sharing about services can help you both**

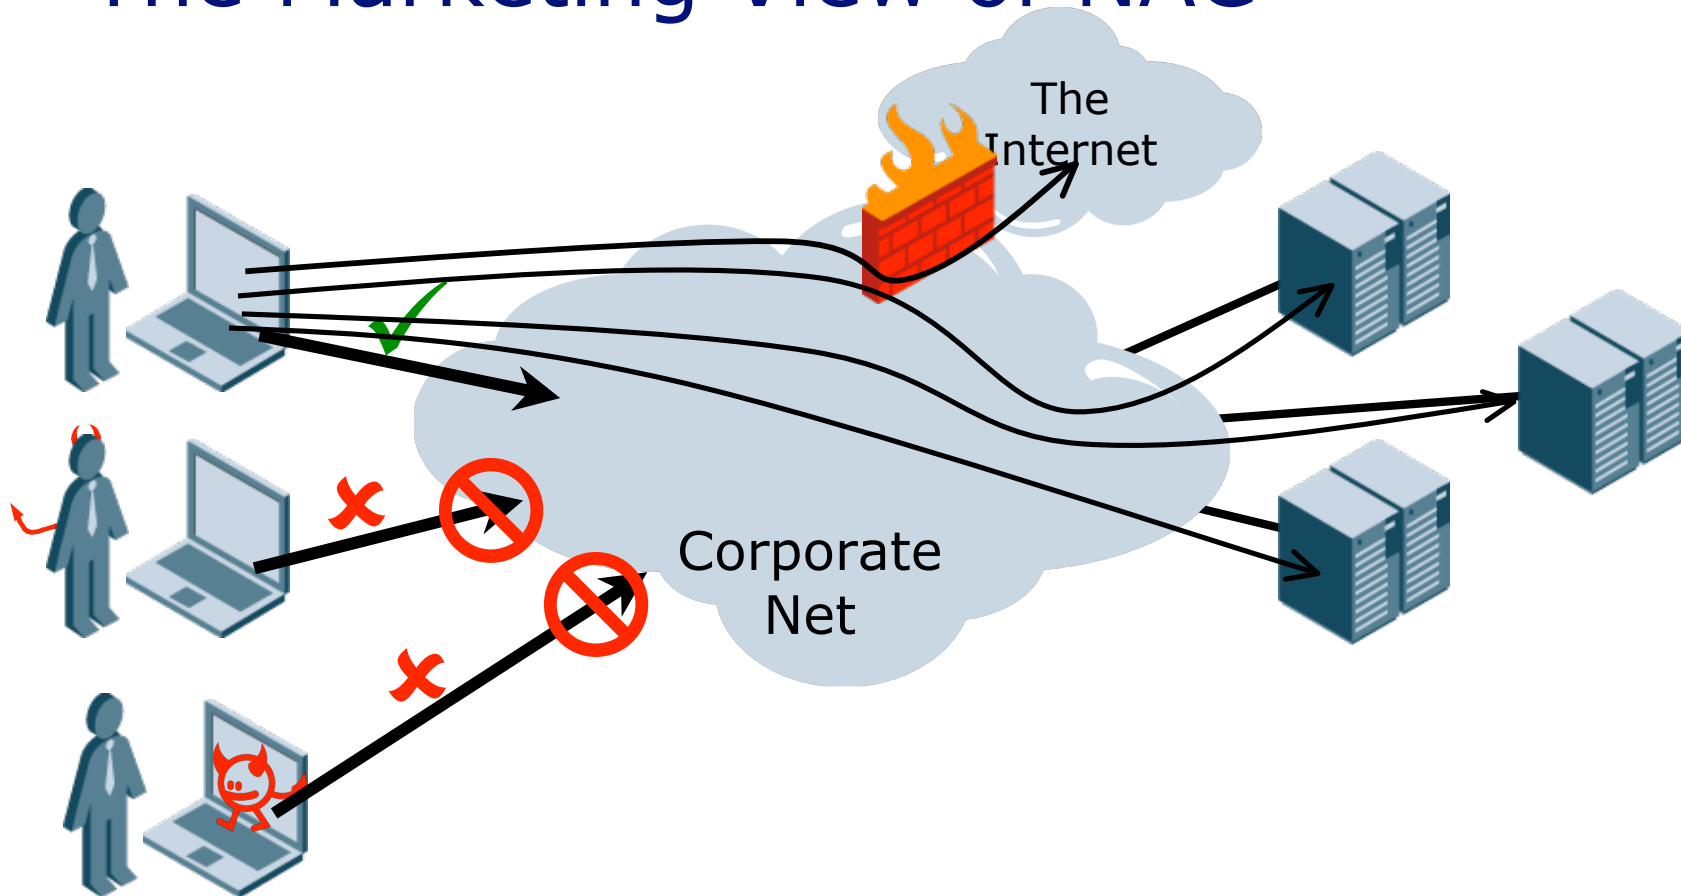

Goal:

Ensure only  
Authorized and  
"Safe" Users  
Connect to the  
Network

Strategy:

Use Network  
Access  
Control (NAC)  
to Authenticate,  
Validate, and Control  
all network usage

# The Marketing View of NAC

# NAC Has Four Components

1. Authentication of the user

**End users are authenticated before getting network access**

# Environmental Information Modifies Access or Causes Remediation

1. Authentication of  
the user

2. Use  
environmental  
information as  
part of policy  
decision making

**Where is the user  
coming from ?**

**When is the access  
request occurring?**

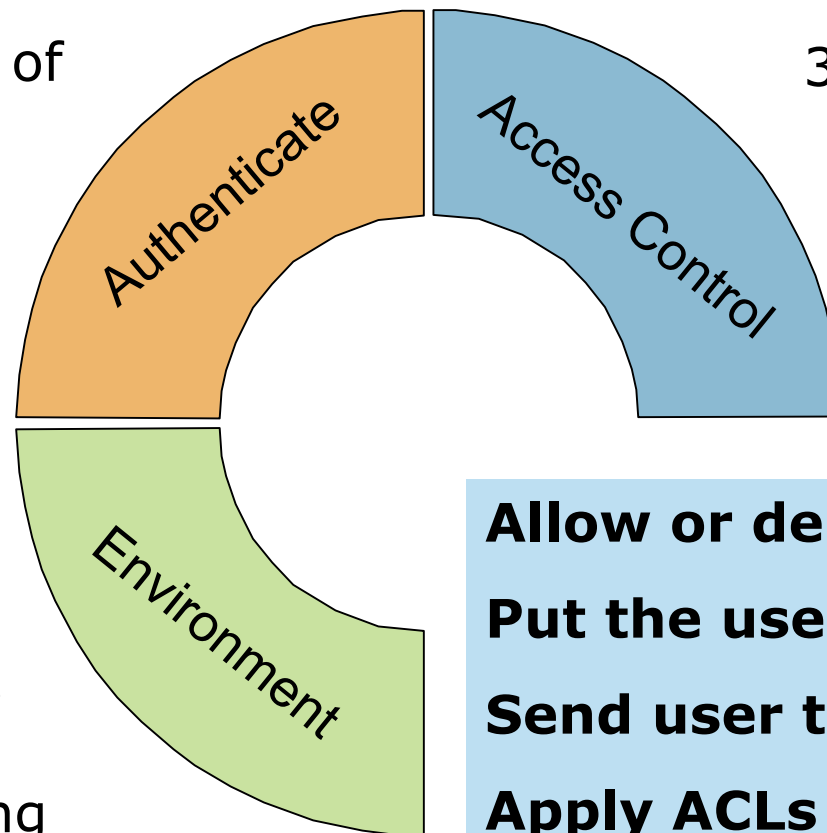

**What is the End Point  
Security posture of  
the end point?**

# Access Controls Define Capabilities and Restrict the User

1. Authentication of the user

3. Control usage based on capabilities of hardware and security policy

2. Use environmental information as part of policy decision making

**Allow or deny access.**  
**Put the user on a VLAN.**  
**Send user to remediation.**  
**Apply ACLs or firewall rules.**

# Management of Policy is the Weak Link in most NAC Solutions

## Action Items: Network Access Control

- **Roll out authentication using 802.1X (you can call it WPA2) on wireless networks**
- **Meet with desktop team to discuss end-point security assessment and remediation strategies and how they would fit in NAC**
- **Inventory network assets (embedded devices and network devices) to determine how NAC would affect the network**

# Thanks!
